Contents

<i>Preface</i>	
<i>List of Contributors</i>	
1. Riparian Plant Diversity of Lentic Systems in Rural and Urban Landscapes of Barak Valley, Assam <i>Poppy Rajbongsi and Tapati Das</i>	1-13
2. An Allometry-Based Biomass Estimation and Carbon Distribution in the Semi-Arid Delhi Ridge Forest Ecosystem <i>A. Hasan and Ratul Baishya</i>	14-28
3. Traditional Uses of Aquatic Macrophytes by Ethnic Communities Residing in and Around Chatla Floodplain Wetland of Barak Valley, Assam <i>Nami Prasad, Tapati Das and Dibyendu Adhikari</i>	29-37
4. Ecological Analysis of Sacred Groves and its Conservation <i>Krishna Upadhyaya</i>	38-58
5. Wetland Ecosystem Services and its Valuation with Special Reference to India: A Review <i>Priyanka Sarkar and Tapati Das</i>	59-76
6. Understanding Soil Microbial Diversity: A Review <i>Bibhuti B. Das and M.S. Dkhar</i>	77-90
7. Land Ownership System and Status of Forests of Garo and Khasi Hills Autonomous District Councils of Meghalaya <i>Kiranmay Sarma</i>	91-100
8. Anthropogenic Threats to Orchids in Meghalaya with Special Reference to Trade in Wild Orchids <i>Jasmine T. Sawian and Elvinocia Dohling</i>	101-112
9. Status and Threat to Grasslands of North East India with Special Reference to Protected Areas <i>Manabendra Ray Choudhury, Panna Deb and Hilloljyoti Singha</i>	113-129

10. Limestone Mining in Meghalaya: An Ecological Perspective
Larilin Kharpuri, A A Mao and Subhasish Das Gupta 130-14
11. Potential of Bamboo Species in Ecological Restoration of the
 Degraded Lands in Meghalaya, Northeast India
Ublari Shilla and Aabid Hussain Mir 149-15
12. Climate Envelope Modelling of *Pandanus tectorius*
 Soland ex Parkins. (Screwpine) for its Conservation in the
 Eastern Himalayan and Northeastern Region of India
D. Adhikari and S.K. Barik 159-16
13. Community Based Forest Management in India
Aabid Hussain Mir and Krishna Upadhyaya 167-18
14. Western Arunachal Pradesh, Centre of *Rhododendrons*:
Needs Urgent Conservation
Ashish Paul, Mohamed Latif Khan and Ashesh Kumar Das 185-20
15. Modelling the Distribution of a Few Lesser known
 Bamboo Species of Meghalaya and Determining
 Areas for Their Conservation
E. Kharlyngdoh, D. Adhikari and S.K. Barik 202-21
16. *Illicium griffithii* Hook. f. & Thoms. a Medicinally
 Important Threatened Plant of Northeast India:
Need for Inventorization, Characterization and Propagation
for Improving Economic and Conservation Status

SUPRIYA

East of India is one of the most diverse regions of South Asia. It is globally acknowledged for its rich eco-cultural practices enriched with varied traditional knowledge related to environmental conservation and sustainable natural resource management. The chapters of this edited book represent a valuable contribution in the field of environmental studies. This book reflects the complexity of the environmental issues and tries to navigate the complex relationship of environment with society and culture to comprehend the issues and concerns that are being faced by North East India. In all this book consists of 38 research papers contributed by scholars of repute.

Dr. Dilip Sarkar has been teaching English in various colleges and universities at undergraduate and post graduate level in Tripura since 1985. Presently he is the Principal of Bir Bikram Memorial College, Agartala, Tripura. He was awarded PhD for his research work "Culture and Environment: A Critical Study of the Plays of Arnold Wesker". He has participated in many national and international seminars and conferences. Again his innovative thoughts are exposed in his published articles published in reputed journals. Dr. Sarkar is a keen observer and commentator on the socioeconomic, educational and political scenario of India, especially of Tripura.

Dr. Nandini Gupta is an Assistant Professor of Environmental Sciences in Bir Bikram Memorial College, Agartala, Tripura. She received her M.Sc. in Environmental Sciences from the University of Kalyani, West Bengal. Her areas of research include pollution biology, environmental microbiology and toxicology. She has published many research articles and research papers in books and journals of international repute. She is the life member of Indian Science Congress.

[ABSTRACT]: A study was conducted in the wetland rice fields of Karimganj district in Assam to investigate its water quality and the various planktonic and periphytic communities. Water quality parameters such as temperature, pH, dissolved oxygen, biological oxygen demand, free CO₂, alkalinity and nutrients like nitrate-N and phosphate-P were analyzed. Besides, qualitative and quantitative analysis of phytoplankton, zooplankton and periphyton communities of the wetland rice fields were also done. It was observed that some of the important water properties of the wet rice field like, water depth ranged from 2.7 to 9.87cm, water temperature fluctuated from 22.33 to 37°C, dissolved oxygen ranged from 2.09 to 12.16 mg l⁻¹, free CO₂ varied from 2.66 to 5.99 mg l⁻¹, pH fluctuated from 4.05 to 6.04. The study also revealed the presence of 25 genera of phytoplankton and 30 genera of periphyton belonging to 4 major classes viz., Bacillariophyceae, Chlorophyceae, Cyanophyceae, and Euglenophyceae;

Plankton Diversity of Wet Rice Fields as Indicator of Water... 25

8 genera of zooplankton belonging to 3 major groups viz., Cladocera, Copepoda and Rotifera.

The present study shows that the wetland rice fields are rich depository of natural food resources for fishes. The study also highlights the scope for utilization of the planktonic and periphytic communities in wet rice field by introducing the concurrent practice of rice and fish culture.

KEYWORDS: Water properties, wetland rice field, phytoplankton, zooplankton, periphyton.

INTRODUCTION

Rice fields are dynamic, temporary and transitional ecosystems that have been managed by man in collaboration with nature since time immemorial and wet rice-fields are the most extensive freshwater aquatic ecosystem on earth with more than 1.5 million km² as shown by Fernandez et al. (2004). Wet rice environment provides the richest habitat of aquatic organisms as shown by Fernando (1993).

Karimganj district located in the south-western part of southern Assam is the only district that constitutes almost 30% water covered area especially in its wetlands. The water is retained in the wetlands for more than 6 month in a year. Here, 70% of total rural populations are directly involved in agriculture and on an average 15% of total rural population are in fishery sector.

In Karimganj, like other two districts of Barak Valley in South Assam, cultivation of wetland rice locally called as 'Borus rice' or 'Boro rice' is done in the low lying areas of wetlands (locally called as 'beels' and 'haors') where the soil remains saturated with water and nutrients throughout the year due to entry of nutrient rich runoff water from the surrounding upland areas. Subramanian et al. (2000), in their studies revealed that the flooded rice fields like any aquatic systems are rich in planktonic and periphytic
